

Activity 1: SQL Practice

Create the following table.

None

```
CREATE TABLE employees(  
  emp_id INT,  
  emp_name VARCHAR(50),  
  department VARCHAR(30),  
  salary INT,  
  city VARCHAR(30)  
);
```

Insert the data.

None

```
INSERT INTO employees VALUES  
(101, 'Rahul', 'HR', 45000, 'Chennai'),  
(102, 'Anu', 'IT', 65000, 'Bangalore'),  
(103, 'John', 'Sales', 55000, 'Mumbai'),  
(104, 'Meera', 'IT', 70000, 'Hyderabad'),  
(105, 'Kiran', 'HR', 48000, 'Chennai'),  
(106, 'Divya', 'Marketing', 60000, 'Pune'),  
(107, 'Arun', 'IT', 75000, 'Bangalore'),  
(108, 'Sneha', 'Sales', 52000, 'Delhi');
```

Write SQL queries for:

1. Display all employee details.
2. Display only Employee Name and Salary.
3. Display employees working in the IT department.
4. Display employees whose salary is greater than 60,000.
5. Display employees from Chennai.
6. Display all employees ordered by salary (ascending).
7. Display all employees ordered by salary (descending).
8. Display distinct departments.
9. Display distinct cities.

10. Display employees whose department is 'Sales'.

Activity 2: Real-World SQL Challenge

Imagine you are a Data Analyst in an e-commerce company.

The company has an **orders** table.

Order_ID	Customer	City	Category	Amount
101	Asha	Chennai	Electronics	25000
102	Ravi	Delhi	Furniture	12000
103	Asha	Chennai	Electronics	18000
104	John	Mumbai	Clothing	3500
105	Priya	Bangalore	Electronics	42000
106	Ravi	Delhi	Furniture	15000

Write SQL queries to:

1. Display all orders.
2. Display only Customer and Amount.
3. Display all Electronics orders.
4. Display all orders where Amount > 20,000.
5. Display unique customer names.
6. Display all orders sorted by Amount (highest first).
